She has a joint appointment in the Psychology Department at Stanford University and the Center for Talent Development in San Francisco. Her book *Mindset: The New Psychology of Success* is based on a decade of research. Time to reflect No, I don't. I think about and meditate about it when it is relevant to the situation. I don't like worrying about it. Sometimes it's difficult to predict, and if you're thinking about the future you're not going to be fully focused on the present. Tongliu Xing, co-author of the book *How We Decide* and one of the world's most eminent researchers in the field of judgment and decision making, said that he was reminded of the future at the time when he was taking up studying philosophy. He often feels that his intuition could not predict the future, which is the consequence of his process of thinking, which aims to understand the world and the true self. This year of life and the times to come are gifts, but only to be received once we are born. Chinese poet Tu Fu said: "Each year is the complete heart of a man." As life is short, we should make the most of each one and live each moment for what it is. This

invention relates to a photocathode, particularly to one having excellent durability and reproducibility. In general, the photocathode is made of a low-emissivity layer of a-Si film formed on a metal substrate and having a reflectance of about 60% at a wavelength of 200 nm. It has a sufficiently high quantum yield of as high as 50% to 100%, which is obtained by mixing an electron trap material in the a-Si film. The invention also relates to a method of manufacturing such a photocathode. A conventional photocathode is manufactured by forming a low-emissivity layer of a-Si film on a metal substrate and baking the a-Si layer at an electron trap material layer in a vacuum chamber, as disclosed by Y. S. Oh, et al. in *A New Method of Achieving Low Emissivity Aluminum Oxide Film (a-Si)_x* (Applied Physics Letters, 61, 2082, 1992). The above method, however, poses a problem that the metal substrate and the low-emissivity a-Si film would be partially oxidized during the 82157476af
